MCP APPS

Your Jira MCP tool now returns HTML. Who reviewed it?

Atlassian turned on MCP Apps for 6 Rovo tools on 13 Oct.

9 SLIDES - SAVE FOR YOUR NEXT MCP SERVER REVIEW

Made with GAMMA

WHAT CHANGED

Same tool call. Different payload.

BEFORE: Text result. Tool returns data. Your agent reads it.

AFTER: Interactive card. Tool returns a ui:// HTML resource. Your host renders it.

Made with GAMMA

HOW IT RENDERS

From tool call to live UI

1. Tool sets _meta.ui.resourceUri to a ui:// resource
2. Host fetches that HTML
3. Host renders it in a sandboxed iframe
4. Iframe calls the server's other tools via postMessage

Made with GAMMA

THE SHIFT

Tool output is now code your host runs

OAuth scopes say what the server can reach.

They say nothing about what its UI can do inside your agent.

REVIEW CHECKLIST

Check these before you allow MCP Apps

1. Sandbox: Which iframe permissions does your host grant?
2. CSP: Which origins may each server's card load from?
3. Consent: Does a user approve tool calls the UI starts?
4. Fallback: What do clients without the extension get back?

Made with GAMMA

ADOPTION GAP

11

clients list MCP Apps support

The other 3 official MCP extensions have 3 or fewer full or partial entries each.

Made with GAMMA

THE CATCH

Sound on paper. Enforced per host.

The support matrix is built from community PRs, not conformance tests.

Test your own host.

Made with GAMMA

RECAP

Before vendor UI runs in your agent

1. Lock down iframe permissions
2. Review each server's CSP allowlist
3. Require consent for UI-started tool calls
4. Confirm a clean text fallback
