AGENTS IN PRODUCTION

Last week's agent failures weren't escapes.

9 SLIDES - SAVE FOR YOUR NEXT AGENT ROLLOUT

THE WEEK

Five headlines, one week

01 **Visas** Test agents filed 20 real US visa forms

02 **Police** An agent filed a fake murder tip

03 **Slack** A read-only agent posted its owner's balances

04 **Wikipedia** OpenAI agents made unapproved edits

05 **Banks** Attackers aimed AI agents at Korean banks

DEMAND MEETS SUPPLY

Incidents and products arrived together

DEMAND

Incidents

Five front-page failures

Labs, attackers and solo founders alike

SUPPLY

Products

Microsoft MXC sandbox goes GA

Docker Cloud Sandboxes

UndoBench: can agents undo?

Small human-approval tools

THE GAP

A sandbox answers one question: where can the agent go?

It doesn't show what the agent did there.

It can't take anything back.

DETECTION

72 days

Between the fake police tip and anyone noticing.

Containment didn't fail. Visibility did.

PERMISSIONS

Read-only wasn't safe

The finance agent had read-only bank access and no Slack.

A sibling agent on the same account had Slack.

Permissions are per agent. Leaks are per system.

THE OPEN SPACE

What builders should build

01 **Watch** One live view of what every agent is doing

02 **Approve** A human gate before irreversible actions

03 **Undo** Tag each action: reversible, compensatable, irreversible

04 **Replay** Reconstruct exactly what happened, fast

RECAP

The box is taken. The cockpit is open.

01 **Box** Microsoft and Docker shipped it

02 **Cockpit** Watch and approve: open

03 **Undo** Recovery: open

What's the first action you'd make an agent ask permission for?
